

In The Specification

Page 2, lines 6-9, replace the paragraph with the following paragraph:

The invention will be described in detail below, with reference to the enclosed drawings, in which:

*B1* Fig. 1 shows a side view of a nozzle according to the present invention, and

Fig. 2 shows a view in the direction of the arrows A-A, i.e., from the front, and

Fig. 3 shows a front view of a prior art nozzle.

Page 2, lines 16-19, replace the paragraph with the following paragraph:

*B2* The invention is an improvement over the prior art, which had problems in filling out irregularities and corners with the coating material. The problems were ~~also~~ caused by the coating material leaving the nozzle at too low a velocity, due to the low viscosity of the coating material and the design of the nozzle.

Page 2, line 36 – Page 3, line 10, replace the paragraph with the following paragraph:

*B3* As can be seen in Fig. 2, the nozzle has a discharge aperture consisting of a hole pattern, in this case a row of holes 5, debouching into the front surface of the nozzle. According As is shown in Fig. 3, according to the prior art, the corresponding nozzle would have an uninterrupted slot (not shown) 6 with the same extension, at least width, as the hole pattern according to the invention. It should be evident that the discharge area of a nozzle according to the invention is substantially reduced in comparison with the prior art. The number of holes and their individual areas will vary in dependence of the material used. Also suitable pressures and discharge velocities will be dependent on the coating material and the specific application. By way of example, the total discharge area of the nozzle may lie within 10 – 12% of a corresponding uninterrupted discharge opening 6 according to the prior art, such as the prior art nozzle shown in Fig. 3. The nozzle will advantageously be made of stainless steel.
